General Comment: Please consider the adverse impact several of the proposed paragraphs would have on small gun shops that also sell ammunition and reloading components.

Para (c) (3) (iii) (C) would effectively disallow any gun shop or retailer from selling ammunition or reloading components, destroying half their business. Gunsmiths would be unable to do their job since their facility requires test firing firearms but yet would be unable to have the ammunition in the same facility.

Para (e) (1) (iii) if in effect, would a customer who bought reloading components or ammunition have to inform the local fire and police departments to transfer their stuff home? How does UPS and other carriers ever ship reloading components or ammunition?

Para (h) (3) (i) (B) 20 pounds limit on displayed smokeless propellants is completely unreasonable. There are many dozens of variations and brands of powder available on the market. Severely curtailing what product could be displayed is a huge detriment to sales, much less in such small quantities that only one of a few types could be displayed. Furthermore, eight pound containers are necessary and reasonable to competitive rifle shooters.

Para (h) (4) (i) (C) 10,000 small primers is a VERY SMALL amount, considering there are nine basic flavors alone (large/small pistol and rifle, magnum and regular and shotgun, sold in quantities of 1000 typically). That means a retailer could only display one box of each type? What if a customer wanted to buy two boxes of small pistol (which is not an excessive amount for competitive shooters)?

These proposals must be generated from a misinformed source ignorant of the shooting sports and firearms industry. Please reject them.

Thanks.
